

# GN Ellipse Standard

- flexibility & long range mobility

When you are on the phone there is no reason why you should be limited to only move within the length of a cord. In other words, you should feel as comfortable as in a normal face-to-face conversation.

The GN Ellipse Standard is a well-established cordless product that has proved its performance and high quality in the professional working environment. The GN Ellipse is designed for people who wish to take the next step after handsfree use of their telephones.

Simply install the base unit beside the phone and keep your lightweight remote unit connected to the headset. Now you're ready to have a conversation up to 150 meters from your desk.

Not only can you leave your desk to retrieve information without hanging up, you can even answer calls when you are far away from

your desk (with the optional Hook Switch). When IP connectivity is required, the optional GN SeleCT allows you to switch between your PC and telephone.

GN Netcom has chosen the 1.8 GHz DECT technology for the GN Ellipse family, because it is superior to any other cordless technology, providing enhanced quality of speech, longer range, and increased number of simultaneous users.

The GN Ellipse Standard can be connected to all of the most commonly used telephones and telephone systems. And for even greater flexibility, any GN Netcom headset can be used with the GN Ellipse Standard.
